

Annex 13 – Example of weekend water consumption survey

Water consumption is closely monitored on several levels, for example:

- Overall water consumption
- Water consumption per building
- Water consumption for the cooling towers
- Water consumption for on campus businesses
- Water consumption for gardening & irrigation

The table on the right presents water consumption for various buildings for weekends only. As activity during the weekend tends to be less extensive, variations in the Baseline Consumption can be detected. If variations cannot be attributed to known activities, then the cause could be a leak, and appropriate steps are taken to detect and correct the fault.
